

EnduraData: EDpCloud Use Case in Health Care

I. THE ENVIRONMENT

Healthcare focused companies, including hospitals, specialty clinics and third party providers generate a significant amount of data from healthcare software systems, labs, internal operations, confidential customer data and government sources, etc. Data may include images or other large files.

II. THE CHALLENGES

The amount of data within a healthcare organization is increasing at an exponential rate. This "Big Data" expansion creates new challenges. This includes:

- Sharing data across national and international networks in a timely and secure means
- Providing enterprise backup and business continuity capabilities
- Facilitating consolidation and aggregation from disparate systems and locations for efficient analytics, faster decision making and better outcomes
- High risks of errors, of breaches and of high costs
- Leveraging data for better outcomes and effective decision making.

There are a range of approaches to address some of the issues discussed above. But up to this point, few are available, without scripting or other manual methods, to address all of the data and file format requirements.

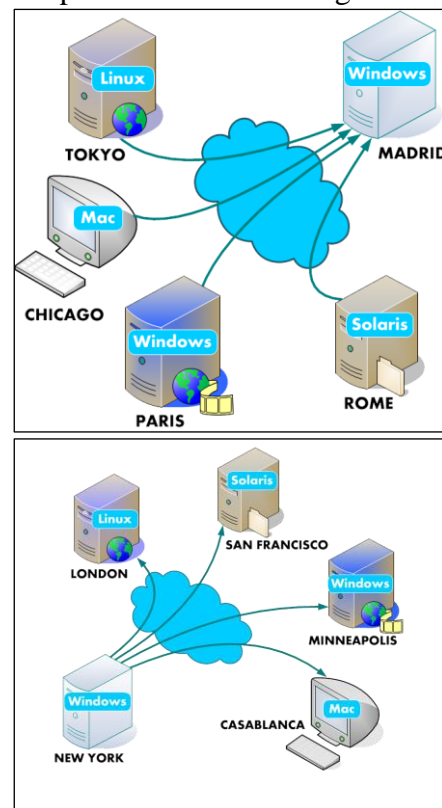

III. THE RESOLUTION

EnduraData has developed and successfully implemented a secure automatic cross platform data transport approach that helps in the consolidation, distribution and migration of a wide range of data from different systems. EDpCloud is available on

Unix, Solaris, Linux, Mac, Windows and AIX. The result is an effective means of synchronizing data over the internet or private networks using enhanced forms of encryption. The solution helps with transporting the data quickly, securely, automatically..

IV. THE VALUE

Companies can now share data faster and with the confidence that it will be transmitted, stored and organized for business continuity and secure sharing. The accelerated data movement, data aggregation, data backup and data recovery capabilities for heterogeneous hardware and operating systems helps reduce costs, errors and risks and improve decision making
